

Provider

State: is data that can change while the app is running

ex:

Product List

Logged-in user

Shopping cart

Dark/light theme

=====

=> setState(): rebuilds the widget when data changes

Advantages: Simple, easy to learn

Disadvantages:

Difficult to maintain in large projects

cannot easily share data across screen

=====

Provider: is a state management library (Flutter)

It helps to:

Manage data centrally

Share data between widgets

Automatically update the UI

=====

Provider Architecture

UI

|

Provider

|

API service

|

Backend (Nodejs) (1)

|

MySQL

=====

Data Flow

User => Button => Provider => API => Nodejs => MySQL

=> Provider => notifyListeners => Flutter UI
