

Tuan 6.2 – CRUD API + Client server architecture

Modern application follow the Client-server architecture

Client:

Display UI

Sends requests

Server:

Processes data

Returns responses

=====

REST API

is a standard communication mechanism between Client and Server.

Each URL represents a resource

=====

CRUD represents four fundamental operation of any information system

Create (POST); Read(GET); Update(PUT); DELETE (Delete)

=====

Flutter sends a Request

The server processes the request and returns a response

=====

JSON is the most common data format used in Web APIs

Advantages:

Lightweight

Platform-independent

=====

Data Flow

Flutter -> POST request -> Nodejs -> RAM /Database -> JSON response ->

Flutter UI

Note: Flutter and Server must keep their state synchronized

Flutter is responsible for displaying data

The server is responsible for managing data and business logic
